# **DEGREES AND DIPLOMA**

Apart from degrees and diplomas that may be instituted by the University in future the Faculty confers the following degrees and diploma in the Agriculture Program:

Degree/Diploma	Abbreviation
<b>Diploma</b> Diploma in Agriculture	Dipl.Agric.
<b>Bachelor's degrees</b> Baccalaureus Scientiae Agriculturae Baccalaureus Agriculturae	B.Sc.Agric. B.Agric.
Honours degrees Baccalaureus Scientiae Agriculturae Honores Baccalaureus Agriculturae Honores	B.Sc.Agric.Hons. B.Agric.Hons.
Master's degrees Magister Scientiae Agriculturae Magister in Sustainable Agriculture Magister Agriculturae	M.Sc.Agric. M.V.L. M.Agric.
<b>Doctor's degrees</b> Philosophiae Doctor Doctor Scientiae	Ph.D. D.Sc.

#### **REGULATIONS AND INFORMATION**

#### DIPLOMA IN AGRICULTURE AND FIRST BACHELOR'S DEGREES

Degrees

The following diploma and first bachelor's degrees are awarded in the Agriculture Program:

Degree	Minimum period of study	Abbreviation
Diploma in Agriculture	2 years	Dipl.Agric.
Baccalaureus Agriculturae	3 years	B.Agric.
Baccalaureus Scientiae Agriculturae	4 years	B.Sc.Agric.

#### OVERARCHING FACULTY REGULATIONS, INFORMATION AND TRANSITIONAL MEASURES

#### INFORMATION

All prospective B.Sc.Agric. students should take Life Scinces or Physical Sciences for the National Senior Certificate, over and above Mathematics, which is compulsory.

#### Module codes

All undergraduate modules are presented as semester modules. The weights awarded to the different semester modules are measured in teaching credits. A teaching credit equals ten teaching hours per semester.

The alphabetical code indicates the name of the specific subject. The modules are numbered. The first digit indicates the academic level of the module, but not necessarily the academic year of presentation for example, 100-level modules are introductory in nature; 200-level modules and higher are more advanced.

The second digit indicates the examination month - whether the semester examination in that particular module is written in June or November. Uneven numbers, 1, 3, 5 and 7, apply to the first semester (June examination). Even numbers, 2, 4, 6 and 8 apply to the second semester (November examination). Nought (0) indicates a year module where examination is written in November.

The third digit must be multiplied by 4, to indicate the number of teaching credits of the module. For example, AGR354 indicates an advanced Agronomy module, presented during the first semester, and worth 16 teaching credits.

#### REGULATIONS

**Nota Bene:** The general regulations regarding first bachelor's degrees (General Regulations A1 to A31) apply to this faculty *mutatis mutandis*.

#### Reg. H1 - Admission requirements

- (a) See General Regulations A2 and A3.
- (b) In addition to the requirements contained in General Regulation A2(a), a candidate has to comply with the following additional faculty requirements:

#### For persons who matriculated before 2008, the following is applicable:

- (i) For admission to the B.Sc.Agric. degree an E-symbol in Grade 12 Mathematics (higher grade) or a C-symbol in Grade 12 Mathematics (standard grade) is a minimum prerequisite. A pass in Grade 12 Science and/or Biology is recommended.
- (ii) For admission to the B.Agric. degree Grade 12 Mathematics (Standard Grade Fsymbol) or N4 Mathematics is a minimum prerequisite. The Dipl.Agric. can allow admittance to the final year B.Agric. provided that LWL194, if not yet obtained, must be additionally presented.
- (iii) For admission to the Dipl.Agric. the minimum requirement is a Grade 12 Certificate with an M-score of at least 24.

# For persons who obtained the national senior certificate in 2008 or later, the following is applicable:

#### Faculty specific admission requirements for the B.Sc. Agric.:

- (i) A minimum AP score of 28 plus a performance level 4 in an official tuition language.
- (ii) Mathematics on performance level 4.
- (iii) Physical Sciences or Life Sciences on performance level 3.

#### Faculty specific admission requirements for the B. Agric .:

- (i) A minimum AP score of 28 plus a performance level 4 in an official tuition language.
   (ii) Mathematics on performance level 3.
- The Dipl.Agric. can allow admittance to the final year B.Agric. provided that LWL194, if not yet obtained, must be additionally presented.

#### Faculty specific admission requirements for the Dipl. Agric.:

(i) A minimum AP score of 23 plus a performance level 4 in an official tuition language.

#### Reg. H2 - Re-admission requirements

See General Regulation A19.

#### Reg. H3 - Insertion of modules on the time table

The curricula of the agricultural programme consist as from the second year of study of compulsory and selective modules. It is the responsibility of the student to ensure that the relevant selective modules that he/she wants to select, do not clash with each other or the compulsory modules on the time table. Provision will be made to accommodate the compulsory modules on the time table as far as possible.

#### Reg. H4 - Pass requirements

- (a) See General Regulation A17.
- (b) The aggregate mark for modules in this faculty is the arithmetic mean of the semester plus the examination mark, rounded to a whole percentage unless stipulated differently in the module manual.
- (c) A semester mark of 50% is needed for passing a module in which no official examination is required.

#### Reg. H5 - First degrees with distinction

(a) See General Regulation A18.

#### Reg. H6 - Presentation of seminar modules

- (a) The seminar modules can only be taken simultaneously with all the prescribed final year modules of the particular major subject, in the same semester or afterwards, with due regard for further preconditions applying to certain seminar modules.
- (b) If a student needs only modules of the first- (or second-) semester to complete her/his degree, as well as either one or more seminar modules, which may be presented in the second- (or first-) semester, he/she can be allowed to complete these modules during the first (or second) semester.

#### Reg. H7 - Changing from Dipl.Agric. to B.Agric.

A prospective B.Agric. student can apply for admission to the B.Agric. learning programme before receiving the Dipl.Agric. qualification, on the following conditions:

- (i) That the prospective student is in possession of an endorsed Grade 12 Certificate (matriculated before 2008);
- (ii) that LWL194, if not already passed, is additionally enrolled for;
- (iii) that the compulsory first year modules of the B.Agric. learning programme, have already been passed.

#### Reg. H8 - Changing from B.Agric. to Dipl.Agric.

A student who has registered for the B.Agric. degree, can obtain the Dipl.Agric.:

- (i) if the candidate has passed all the modules required for the Diploma in the first academic year;
- (ii) has obtained at least 104 credits on second year level\*;
- (iii) has passed LWL224.

\*SOS112 and SOS124 qualify as second year modules.

#### Reg. H9 - Changing from B.Agric. to B.Sc.Agric.

A student who has registered for the B.Agric. degree, can change to a suitable Learning programme in the B.Sc.Agric. degree, in consultation with the Academic Student Services, but only if the student has passed the compulsory first academic year of the B.Agric. degree with an average mark of at least 70% and additional first-year B.Sc.Agric. modules enrolled for in consultation with the Programme Director to comply with the minimum prerequisites for Professional registration (SACNASP). In such a case the first academic year B.Agric. will be considered as a deviation from the first academic year for the B.Sc.Agric. In changing to a B.Sc.Agric, Learning programme compliance with the prerequisites is essential. Credit will be given for modules that have been passed in the second and/or third academic year.

#### Reg. H10 - Changing of curricula

A student can in exceptional cases submit a motivated application to the Dean to change the module composition of a Learning programme.

Reg. H10(a) – Students who passed grade 12 Information Technology (IT) on performance level 4, or Computer Application Technology (CAT) on performance level 5, are exempted from BRS111.

#### DIPLOMA IN AGRICULTURE

#### Dipl.Agric.

#### INFORMATION

#### Study aims

The study aims entail the training of students in the basic principles and skills needed for agricultural production. After obtaining the qualification, the student will have background knowledge of the natural sciences and management principles that are applicable to agriculture.

#### Faculty specific admission requirements for the Dipl. Agric.:

A minimum AP score of 23 plus a performance level 4 in an official tuition language.

There are four learning programmes for the Dipl.Agric. qualification.

Specialisation	Study code	Learning programme
Animal Production	5011	1
Crop Production	5012	2
Agricultural Management	5013	3
Natural Resources	5014	4

#### BACCALAUREUS AGRICULTURAE

#### **B.Agric.**

#### INFORMATION

#### Study aims

The objective of the degree is the training of students who will be able to apply agricultural knowledge practically on farm level as well as in agricultural related organisations. The B.Agric. qualification will allow persons to apply their knowledge in the fields of resource utilisation, agricultural production, processing, management and communication.

#### Faculty specific admission requirements for the B. Agric.:

- (i) A minimum AP score of 28 plus a performance level 4 in an official tuition language.
- (ii) Mathematics on performance level 3.
  - The Dipl.Agric. can allow admittance to the final year B.Agric. provided that LWL194, if not yet obtained, must be additionally presented.

A prospective B.Agric. student can apply for admission to the B.Agric. learning programme before receiving the Dipl.Agric. qualification, on the following conditions:

- (i) That the prospective student is in possession of an endorsed Grade 12 Certificate (matriculated before 2008);
- (ii) that LWL194, if not already passed, is additionally enrolled for;
- (iii) that the compulsory first year modules of the B.Agric. learning programme, have already been passed.

#### BACCALAUREUS SCIENTIAE AGRICULTURAE

#### INFORMATION

#### Study aims

The objective is the training of scientists who, through research and practically orientated development, can promote a scientific subject in particular or agricultural science in general. After acquiring the B.Sc.Agric. qualification, the person will have the following skills, e.g. problem identification and aim formulation, collecting and verification of data, systematisation and interpretation of data, effective communication of information and making recommendations.

#### Faculty specific admission requirements for the B.Sc. Agric .:

- (i) A minimum AP score of 28 plus a performance level 4 in an official tuition language.
- (ii) Mathematics on performance level 4.
- (iii) Physical Sciences or Life Sciences on performance level 3.

#### Major subject combinations

There are different curricula for the degree B.Sc.Agric. with the following major subject combinations:

Specialisation	Study code	Learning programme
Agricultural Economics (General)	5337	17
Agricultural Economics/Agronomy	5322	2
Agricultural Economics/Animal Science	5354	24
Agricultural Economics/Food Science	5339	19
Agricultural Economics/Natural resources	5338	18
Agronomy/Agricultural Economics	5322	2
Agronomy/Agrometeorology	5323	3
Agronomy/Animal Science	5326	6
Agronomy/Entomology	5351	31
Agronomy/Food Science	5327	7
Agronomy/Grassland Science	5328	8
Agronomy/Plant Breeding	5324	4
Agronomy/Plant Pathology	5325	5
Agronomy/Irrigation field	5329	9
Agronomy/Soil Science	5321	1
Agrometeorology/Agronomy	5323	3
Agrometeorology/Grassland Science	5341	21
Agrometeorology/Plant Pathology	5340	20
Agrometeorology/Soil Science	5334	14
Animal Science	5345	25
Animal Science/Agronomy	5326	6
Animal Science/Agricultural Economics	5344	24
Animal Science/Food Science	5346	26
Animal Science/Grassland Science	5347	27
Food Science/Agricultural Economics	5339	19
Food Science/Agronomy	5327	7
Food Science/Animal Science	5346	26

Food Science/Biochemistry	5348	28
Food Science/Chemistry	5350	30

Particulars regarding the syllabuses of modules falling under other faculties can be found in the calendars of the faculties concerned.

The syllabuses of modules offered by the various departments of Agriculture follow.

## **Agricultural Datametry**

#### DMT214 (16 credits) - Agricultural Datametry

Three lectures and a three hour practical per week.

One examination paper of three hours.

The student will learn how to calculate and interpret statistics (mean, variance, analysis of variance (ANOVA) and multiple comparison of means) from various experimental designs. Data sets will be analysed during tutorials to illustrate the techniques learned.

#### DMT224 (16 credits) - Agricultural Datametry

Three lectures and a three hour practical per week.

One examination paper of three hours.

The student will learn about regression (simple linear regression and multiple regression), correlation and co-variance analysis. Data sets will be analysed during tutorials to illustrate the techniques learned.

#### DMT322 (8 credits) - Statistical analyses

One lecture and a three hour practical per week.

One examination paper of two hours (Including analysis of data on a computer)

After completion the student will be able to use software packages in the analyses of ANOVA designs (fully randomized design, randomized complete block design, Latin squares, factorial experiments, (co)variance analyses), regression analyses (linear, non linear, multi linear), frequency tables and Chi square analyses of categorical data, graphical presentations, univariate and mixed model analyses applicable to Agricultural related industries. The ability to interpret and to make inferences regarding the analysed data will also be mastered.

## **Agricultural Economics**

#### LBB344 (16 credits) - Strategic agricultural management (Department of Agricultural Economics) Three lectures and a three hour practical per week.

One examination paper of three hours.

Strategic thinking is in the present turbulent agricultural environment of crucial importance. In this module the student will gain knowledge about implementing the steps in strategic management as well as the tasks of the strategic manager; strategic management of new technologies; developing creative and innovative thoughts; setting a paradigm shift for a farm; re-engineering of a farm; drawing a scenario for any agricultural product or possible outcomes in the future; discounting droughts strategically in the decision-making process; developing a community development programme for any community (commercial agriculture) in the form of an executable plan. **Practical work** 

Development of a paradigm shift, re-engineering, scenarios and strategic plan for a farming business and a community development project as well as creativity exercises; practical

demonstrations of new technologies in agriculture.

#### LBB362 (8 credits) - Seminar in agricultural management

(Department of Agricultural Economics)

Written seminar plus an oral examination.

After completion of this module the student will be able to develop an integrated farm management model on a spreadsheet and to defend the model in an oral exam.

#### LEK122 (8 credits) - Economic development in Africa (Department of Agricultural Economics)

Two lectures per week.

One examination paper of two hours.

After completing this course the student will understand the different phases in the economic development of Africa. The student will also have a broader understanding of the economic problems with which Africa is struggling. Africa's position in the world and the impact which the rest of the world will have on Africa will also be understood by the student. Factors causing poverty in Africa and possible solutions will be treated in an introductory fashion.

#### LEK124 (16 credits) - Economic management of resources

#### (Department of Agricultural Economics)

Three lectures and a three hour practical per week.

One examination paper of two hours.

After the completion of this module the student will understand the role of resources in the economy, the structure of international systems and South Africa's position in the world economy. The student will also have knowledge about factors that influence the demand and supply of products, market forces and the determination of prices, optimal input/input; input/output and output/output relations in resource management and the influence of natural and economic conditions on the use of resources.

**Practical work** 

Use of a computer to do practical analysis

#### LEK214 (16 credits) - Agricultural finance

#### (Department of Agricultural Economics)

Three lectures and a three hour practical per week.

One examination paper of three hours.

After the completion of this module the student will have knowledge about the purpose and components of a farm record keeping system. The handling of depreciation, also in terms of the income tax act as well as the procedure for taking the impact of inflation into consideration. The purpose, components, completion and analysis of each of the financial statements. An economic and financial analysis of a farming business with interpretation and advice on the results. Budgets for different enterprises (both livestock and crops). Development of a financing policy for a farming business and the identification of financing requirements to be able to obtain and manage credit. Financial planning with the help of different budgeting techniques.

#### Practical work

Upkeep and analysis of farming records and application of different techniques, also by means of a personal computer.

## LEK224 (16 credits) - Farm planning and management

(Department of Agricultural Economics)

Three lectures and a three hour practical per week.

One examination paper of three hours.

The main purpose of this module is to enable the student to analyse and plan changes (risks and opportunities) within a farming business.

The module is divided into two sections: Section I, which consists of the planning of livestock and crop production enterprises, and Section II which consists of the composition of livestock and crop production enterprises in a whole farm production plan, given the marketing and financial plans, which include mechanisation and human resource planning as well as the planning of the business agreement. The focus is further placed on all aspects of human resource management.

### Practical work

The development of enterprise budgets, mechanisation planning, human resource planning and practical exercises to apply risk management instruments in practice.

## LEK314 (16 credits) - Agricultural marketing

(Department of Agricultural Economics)

Three lectures and a three hour practical per week.

One examination paper of three hours.

The objective with this module is to provide the student with knowledge in micro and macro marketing, price theory, utility theory, marketing functions, marketing channels, the international environment, grain marketing strategies and marketing hints, as well, as strategic marketing which will empower producers and agribusiness to formulate and implement strategic marketing plans. Practical work

The analysis of different market scenarios on computer.

#### LEK324 (16 credits) - Advanced Agricultural marketing (Department of Agricultural Economics)

Three lectures and a three hour practical per week.

One examination paper of three hours.

After the completion of this module the student will understand how to do analysis and interpretations of economical terms such as demand, price and income elasticities. Knowledge of the quantification of agricultural marketing questions, the fitting of supply and demand curves, identification of variables that influence prices, the inter-dependence of the agriculture sector with the rest of the economy, the international environment and strategic planning will be obtained. Practical work

Fitting of supply and demand curves by means of regression. The calculation and use of correlation, standard deviations, etc.

## LEK414 (16 credits) - Managerial economics

(Department of Agricultural Economics)

Three lectures and a three hour practical per week.

One examination paper of three hours.

The student will understand how micro economics provides the framework for "economic" ways of thinking and how this basic knowledge was developed in techniques such as linear programming (LP) that solve agricultural economic problems to make efficient decisions. In addition, the student will have an understanding of the principles underlying decision-making under uncertainty. Practical work

Spread sheet models of production and cost functions. Fitting of production functions by means of regressions. Application of LP-models. Measurement of risk with subjective probabilities. Forecasting.

#### LEK424 (16 credits) - Resource economics (Department of Agricultural Economics)

Three lectures and a three hour practical per week.

One examination paper of three hours.

After the completion of this module the student will have knowledge on the theory of natural resource and environmental economics. Aspects that will be addressed include: property rights, externalities and environmental problems, market and government failures, optimal

use/management of natural resources and the environment with special reference to water, soil, natural vegetation, fisheries and other species, and pollution.

#### Practical work

Application of measuring techniques to determine the economic effects of natural resource and environmental problems. Evaluation of alternative solutions to problems.

## LEK434 (16 credits) - Agribusiness management

(Department of Agricultural Economics)

Three lectures and a three hour practical per week.

One examination paper of three hours.

Agribusiness management structure: a system approach. In this module knowledge is gained on the co-ordination of activities in Agribusiness systems. Market segmentation, market choice and the positioning of the business. Product development, structures and distribution channels. Quality control and improvement. Distribution management and value adding. Product planning, stock control and information technology. Price decisions, business laws and contracting. Development and documentation of a business plan.

#### Practical work

The development of a business plan. Most of the assignments will be computer based.

## LEK444 (16 credits) - Agricultural policy and development (Department of Agricultural Economics)

Three lectures and a three hour practical per week.

One examination paper of three hours.

Knowledge will be gained in this module about the involvement of the government in agriculture, reasons for government interference, how agricultural policy causes distortions and the spill over effect of it, the effect of policy on the welfare of populations and on the competitiveness of agriculture, factors that prevent small scale farmers from becoming surplus producers, transaction costs and the utilisation of new technologies, the role of research in developing countries, the development of human capital and poverty.

#### **Practical work**

Discussion of reading material and analyses of agricultural policy on computers.

#### LEK461 (4 credits) - Seminar in Agricultural Economics

#### (Department of Agricultural Economics)

No formal examination is required.

After the completion of this module the student will understand how to do a written assignment on specific agricultural economic and related topics.

## **Agricultural Engineering**

#### LNG224 (16 credits) - Engineering principles in agricultural practises

(Department of Agricultural Economics)

Three lectures and a three hour practical per week.

One examination paper of three hours.

Engineering skills in aspects of soil and water conservation. The design of water ways, terraces, contours in conservation farming practises. The learning of how to determine flow and the protection of soil conservation works, weirs and farm dams. Recovery of erosion trenches with the help of mechanical control measures. Basic hydraulics and the practical design of stock-watering systems and pipelines.

#### Practical work

The development of designer skills and the application of calculations. Measurements and

standardisation with specific application in the agriculture.

#### LNG314 (16 credits) - Hydraulics

#### (Department of Agricultural Economics)

Three lectures and a three hour practical per week.

One examination paper of three hours.

Knowledge of basic hydraulics and the solving of problems. Applications of hydraulics in the instalment of agricultural networks, pumps and electrical motors. The student must be familiar with the practical implementation and application of escom-networks and tariffs.

#### Practical work

Introduction with irrigation systems, solving of hydraulic problems, determining of HQ-curves of pumps, deciding on pumps and the power requirements of pumps. Practical calculations of electricity tariffs.

## LNG324 (16 credits) - Irrigation systems and irrigation surveying

### (Department of Agricultural Economics)

Three lectures and a three hour practical per week.

One examination paper of three hours.

Ability to determine the use of the relevant irrigation systems in specific circumstances and conditions. Practical experience in the basic planning and design of irrigation systems.

#### Practical work

The learning of methods in the selection of the correct irrigation systems and the determining of the cost effectiveness of the different systems. Practical surveying and design.

## LNG414 (16 credits) - Flood and mechanised irrigation

(Department of Agricultural Economics)

Two lectures and a three hour practical per week. One examination paper of three hours.

Knowledge on the subject, management and evaluation of specific flood and mechanised irrigation systems. The study and application of SAIB norms and principles.

#### Practical work

Design and evaluation of flood and sprinkler systems. Determining the effectiveness of abovementioned systems.

## LNG424 (16 credits) - Specialised micro, drip and underground irrigation systems (Department of Agricultural Economics)

Two lectures and a three hour practical per week.

One examination paper of three hours.

Ability to design, manage and evaluation of drip and micro-irrigation systems. Application of practice directed norms and principles.

#### Practical work

Design and evaluation of drip and micro-irrigation systems. Determining of the effectiveness and cost effectiveness of the above-mentioned systems.

## **Agricultural Extension**

#### LBV224 (16 credits) - Communication and agricultural extension (Department of Agricultural Economics) Three lectures and a three hour practical per week. One examination paper of three hours. Communication: Frame of reference of the sender/receiver; what has to be communicated in a

farming enterprise; communication channels/media/aids (labour councils regarding the transfer and feedback process in communication); communication systems and strategies in a farming enterprise.

**Agricultural extension:** Synopsis of extension and historical development; applied learning theories in extension; communication strategies (diffusion of innovations); extension techniques and methodology (mass communication, group handling, individual contracts); programme planning (work with people); leadership development and leadership identification; management of extension organisations.

## **Agricultural Science**

#### LWL114 (16 credits) - Biological principles in Agriculture

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion the students will be able to apply the principles of the physiology of farm animals and agricultural and horticultural crops within different disciplines in agriculture. The different body systems of the animal and other aspects, i.e. histology, endocrinology, cardiology, urology and reproductive physiology are addressed. The aim is to give background knowledge on the functioning, optimal utilisation and possible manipulation of the physiological processes in farm animals. The inherent physiological differences in plants are demonstrated, the establishment and vegetative and reproductive growth are discussed, while the surveying, transport and working of fertilisers, water and pesticides are addressed. Factors that are involved with crop production, basic principles of breeding theory and relevant parasitic micro-organism are also dealt with.

#### Practical work

Knowledge of the general anatomy of the mammal will be gained from demonstrations of respiratory, circulatory, neurological functioning and physiological principles that are involved in the body. The most important theoretical aspects of crops are practically conducted in the laboratory and greenhouse.

#### LWL134 (16 credits) - Chemical principles in Agriculture

Three lectures and a three hour practical per week.

One examination paper of three hours.

Students will be equipped with simple chemical principles, concepts, processes and calculations that are important in agriculture sciences, especially with respect to soils, plants, animals and food. **Practical work** 

Students will aquire laboratory skills which will be used to do simple chemical experiments that bear reference to soils, plants, animals and food. Reports of these experiments will be submitted for evaluation.

#### LWL142 (8 credits) - Biometric principles in Agriculture

One lecture and a three hour practical per week.

One examination paper of two hours.

The student will be introduced to concepts such as mean, variance, frequencies, probabilities, normal distribution, regression and correlation. This will enable the student to describe statistically and perform elementary analyses of experimental and research data. Tutorials will include collection and analysis of data using a pocket calculator as well as introductory level use of statistical functions in Excel.

#### LWL144 (16 credits) - Biochemical principles in Agriculture

Three lectures and a three hour practical per week. One examination paper of three hours.

The student will be learned how to apply biochemical principles in agriculture, with respect to the use of water as dissolvant, principles of pH and buffer, the chemical composition and importance of carbohydrates, lipids, vitamins and protein nucleic acids. The student will also be learned how to enzyme action, flow of energy and matter throughout the cells, the integration of the metabolically process (aerobic and anaerobic) and the explanation of metabolically disorders, could be applied in the specialised fields in agriculture.

#### Practical work

Students will apply certain biochemical techniques in the laboratory and will become familiar with certain biochemical concepts and principles.

#### LWL154 (16 credits) - Physical and mechanised principles in Agriculture

Three lectures and a three hour practical per week.

One examination paper of three hours.

The learners will be equipped to apply the basic physical concepts with respect to mechanics, hydrodynamics and hydrostatics, electricity, energy and the application of the gas laws in agriculture and agricultural sciences. This knowledge will be used to explain the influence of these processes on the behaviour of animals, plants and the natural resources. The student will be familiar with the SI-system.

#### **Practical work**

The students will gain practical experience by performing laboratory experiments and calculations will be done to illustrate some of the key concepts mentioned above.

#### LWL164 (16 credits) - Microbiological principles in Agriculture

Three lectures and a three hour practical per week.

One examination paper of three hours.

Students that successfully complete this module will be qualified to describe the basic characteristics and importance of micro-organisms, with specific reference to their role in agriculture. This knowledge is based on the introductory cell structure, taxonomy, nutrition, microbial physiology, interaction between micro-organisms and plants or animals, the production of high-quality food products, as well as the factors that corrupt food.

#### Practical work

Students that complete the practical part successfully will be equipped to conduct basic microbiological investigations. The students will also understand the agricultural importance of micro-organisms by virtue of demonstrations of their utilisation/application in food production.

#### LWL172 (8 credits) - Introductory Mathematics

One lecture and a three hour practical per week.

One examination paper of two hours.

This is a basic module in mathematical calculations with the application to introductory agricultural fields. The student will develop skills in the calculation of percentages and ratios. Knowledge and practical use of a pocket calculator. This will enable the student access to a more advanced basic module in mathematics, namely LWL194.

#### Practical work

Calculations will be done applying the theoretical knowledge in solving agricultural orientated mathematical problems.

#### LWL194 (16 credits) - Mathematical calculations in Agriculture

Three lectures and a three hour practical per week.

One examination paper of three hours.

Skills will be developed in arithmetical and mathematical calculations. The use of algebraic and graphical solutions of comparisons as applied in practical problems. The calculation of surface areas and volumes for application in the determination of maximum perimeters, areas and volumes. Basic knowledge of logarithms and exponents and the use of a pocket calculator. The determination of single and compound interest for application in financial systems. Mastering the skills needed to

determine basic areas with the help of differentiation and integration. The use of statistical grouping of data in the calculation of averages and other important values and the application thereof to solve agricultural related problems.

#### Practical work

Calculations will be done applying the theoretical knowledge in solving advanced agricultural orientated mathematical problems.

#### LWL224 (16 credits) - Sustainable production practises

Three lectures and a three hour practical per week.

One examination paper of three hours.

Students will be introduced to the principles of sustainable production practises. Practical orientated experience would be acquired to describe and explain the nature and extent of natural resources, crop and animal production and farm management.

#### LWL 312 (8 credits) - Professional skills

Continuous evaluation. No formal examination is required.

After completion, students will be able to do literature searches, know how to write a scientific review, including technical editing, correct citation and compilation of a bibliography. Students will be trained in oral presentations, with specific reference to the contents and structure and the use of visual media.

## Agronomy and Horticulture

#### AGRONOMY

#### AGR224 (16 credits) - Crop production principles

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion of this module the student will be familiar with the underlying principles important for the production of crops, the role of plant production in South Africa, morphology of these crops and the effect of environmental factors on the growth and development of crops. The student will also have acquired practical knowledge on soil tillage, plant nutrition, sowing and plant practices, crop rotation, irrigation, fertilisation and weed control on a basic level.

#### Practical work

During practicals the student will attain skills regarding the classification and identification of crops, soil tillage, plant propagation, weed control and plant nutrition. Students will also be introduced to basic principles of crop research through simple greenhouse experiments.

#### AGR314 (16 credits) - Production of summer grain, oil and protein rich crops

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completing this module students will be familiar with cultivation practices concerning the most important summer grain, oil and protein rich crops of South Africa. The students will also be able to apply the theoretical and practical aspects of soil tillage, seedbed preparation, planting techniques, plant nutrition and weed control as it relates to these crops, on a higher level.

### Practical work

During practical sessions the student will study the morphology of these crops and skills concerning the practical aspects of crop cultivation will be developed and practised by the students.

#### AGR324 (16 credits) - Production of winter grain, industrial and diverse crops

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completing this module students will be familiar with cultivation practices concerning the most important winter grain, industrial and diverse crops of South Africa. The students will also be able to apply the theoretical and practical aspects of soil tillage, seedbed preparation, planting techniques, plant nutrition and weed control as it relates to these crops, on a higher level. **Practical work** 

# During practical sessions the student will study the morphology of these crops and skills concerning the practical aspects of crop cultivation will be developed and practised by the students.

#### AGR414 (16 credits) - Crop and stress physiology

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion of this module students will be familiar with advanced and recent knowledge regarding enzymology, respiration, photorespiration, the oxidative pentose phosphate pathway, regulation of metabolism, the effect of drought-, heat- and chemical stress on the physiology of a crop, physiological manipulation and the potential for the development of alternative agricultural crops. The subject matter is approached from a research perspective which will enable the student to identify shortcomings in our knowledge as well as to identify future research needs and in this way to make a personal contribution by anticipating post graduate research. The role physiology has to play in the discipline agronomy will be emphasized throughout the module in order to synchronize the two disciplines. The latter will enable students to anticipate ways and means, on submolecular level, to improve the harvestable yield of crops.

#### Practical work

After completion of a series of practicals students will be able to apply the following research techniques successfully: *in vitro* enzyme activity measurement, spectrophotometry, substrate level determinations, respiration rate measurement, the use of radio-active isotopes in research as well as the isolation and purification of secondary metabolites by means of different chromatography techniques.

#### AGR424 (16 credits) - Crop production under protection

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion of this module students will have the required knowledge to manage a greenhouse. They will gain knowledge about the most important crops that are produced under protection in South Africa. Skills will be developed in the following aspects: structures; environmental control; substrates, mineral nutrition and irrigation (hydroponics); insect and disease management, plant growth regulators.

#### Practical work

Students will attain skills concerning the successful production of crops under protection.

#### AGR434 (16 credits) - Research methodology

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completing this module students will be able to plan research as well as to lay out glasshouse, clima-cabinet and field trials. Besides the former, students will also have mastered the skills to handle different research materials, to sample accurately, to determine different plant parameters and to write up the results in the form of a publishable research article.

#### Practical work

Students will be allowed to plan and conduct either a glasshouse or a field trial on their own and also to present, interpret and write up the data in article format.

#### AGR444 (16 credits) - Weed control

Three lectures and a three hour practical per week. One examination paper of three hours.

After completion of this module students will be familiar with aspects concerning the negative effect of weeds on crops, weed biology and the importance thereof for control mechanisms, as well as principles of herbicide selectivity, factors influencing it, usage and chemical classification of herbicides, residual activity, principles of herbicide choice and the herbicide application in order to enable the student to identify and apply these principles in practice. The theoretical aspects of leaf and root absorption of herbicides, translocation, action mechanisms and breakdown in the plant will be covered thoroughly in order to enable the student to make the correct choices when required.

#### Practical work

Students will develop the skills required to be able to identify the most important weeds, collect them in the correct manner, calibrate a herbicide spray and identify the phytotoxic symptoms on crops sprayed with specific herbicides, as well as being acquainted with factors affect the efficacy of herbicides.

#### AGR451/461 (4 credits) - Seminar in Agronomy

No formal examination is required.

Students will obtain experience to accumulate knowledge on an agronomic topic, assimilate this knowledge in an orderly and logical manner according to the requirements for a scientific publication and present the seminar orally in order to prepare the student for addressing audiences during conferences and farmers' days.

#### HORTICULTURE

#### HRT314 (16 credits) - Vegetable production

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion of this module students will be familiar with the growth and development of vegetable crops and also the cultivation practices concerning the most important vegetable crops in South Africa. Students will also be able to apply on a higher level theoretical and practical aspects that include the following: seedling propagation, planting techniques, weed control, plant nutrition, harvesting, handling and storage, as it relates to these crops.

#### Practical work

Student will attain skills concerning the practical aspects of vegetable cultivation, which will enable them to apply it on an advanced level.

#### HRT324 (16 credits) - Fruit production

Three lectures and a three hour practical per week in the second semester One examination paper of three hours.

Students will be introduced to fundamental principles in fruit production such as the biology and phenology of most important fruit crops, dormancy, flowering, pollination, fertilization, fruit set and fruit growth, climatic and soil requirements. A foundation will also be laid in the principles of orchard establishment and management, including propagation methods, cultivar and rootstock choice, orchard design and spacing, fertilization, irrigation, pruning and manipulation techniques, fruit thinning, and harvesting.

#### Practical work

Student will gain practical knowledge and skills regarding important fruit production aspects such as propagation, pruning and fruit thinning. They will also be familiarized with the practical day to day operations on fruit farms with compulsory excursions to fruit production areas.

#### LWR214 (16 credits) - Introduction to Agrometeorology

Three lectures and a three hour practical per week.

One examination paper of three hours.

On completion of this module students will be able to identify and discuss the various climatic elements and appraise the interaction between weather/climate and agriculture on various spatial and temporal scales; describe the climate of any region within Southern Africa and explain the EI Niño Southern Oscillation phenomenon and its influence on worldwide weather patterns; use weather data to schedule irrigation and evaluate the use of wind breaks and frost protection to create more favourable plant environments.

#### Practical work

Students will be familiarised with the automatic weather station, temperature calibration, cloud identification and use of the psychrometric diagram. Buys Ballots law will be tested in synoptic chart analysis and calculation of daily evapotranspiration rate from weather data will be done. Skills will also be developed in irrigation scheduling and crop-ecotope matching with the use of climatic data.

#### LWR314 (16 credits) - Influence of climate on agricultural practices

Three lectures and a three hour practical per week.

One examination paper of three hours.

Upon completion of this module students will have a good knowledge of climatological influences on management and planning decision-making; determination of potential, climatological predictions and production risks of crops and animals; climatic indices (including ENSO) for management and planning during droughts and above-normal rainfall cycles. Content is learned by problem-solving and therefore students will also be able to make applications of the influence of temperature (cold and heat stress), fire danger, frost and pests and diseases on agricultural production in Southern Africa and calculate water requirements and water use for planning and scheduling of irrigation. Practical work

The course is problem-based and a student will be expected to identify, analyse and solve actual problems by collaborating with other students. They must tackle a problem in a structured way, by using all the available resources. In this way the student develops and applies skills during the learning process.

## LWR324 (16 credits) - Climate change and variability

Three lectures and a three hour practical per week.

One examination paper of three hours.

Upon completion of this module students will be able to describe the major causes and characteristics of internal climate variability and externally forced climate change; explain the concepts of radiative forcing and climate feedback; evaluate recently observed changes in climate relative to changes that have occurred in the past; describe the formulation of climate models and evaluate their strengths and weaknesses; discuss the basis, methods and limitations of climate prediction as well as provide a review of the latest climate change projections and how this will affect the agricultural sector together with mitigation and adaptation options.

#### Practical work

Students will be expected to acquire the necessary climate data to analyse and describe the past climate and its variability for a specific location and identify any trends in the climatic record if present. They will also be introduced to basic concepts of climate modelling and contemplate how the climate change projections for their home countries/areas will affect the local agricultural sector.

#### LWR414 (16 credits) - Operational Agrometeorology

Three lectures and a three hour practical per week. One examination paper of three hours.

This module is problem-based and aimed at the development of the analytical, writing and climatological advisory skills of students. They learn these skills through the collection, processing, interpreting and reporting of relevant data and information for long-term planning and operational applications. The students will be able to perform the tasks of an operational agrometeorologist professionally.

### Practical work

Weekly assignments lead students through the process of data collection, analysis and presentation as they write up results, discussions and conclusions in the form and style of an agrometeorological scientific article.

#### LWR424 (16 credits) - Micrometeorology

Three lectures and a three hour practical per week.

#### One examination paper.

Students will obtain a knowledge of micrometeorology – radiation, wind, turbulence, momentum, heat, air moisture, and evaporation; become familiar with mass and momentum transfer and exchange processes in plant communities in connection with radiation, energy and evaporation; gain insight into determination of the influence of the environment on plant processes: photosynthesis, transpiration, leaf temperature and the leaf energy balance; analyse the micrometeorology of urban areas, forests and crops using models and meteorological data.

#### Practical work

Practical skills will be acquired in the calibration of instruments used for observation of environmental variables above and within plant communities and soil surfaces.

#### LWR434 (16 credits) - Physical and dynamical meteorology

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion of this module the student will be able to describe the atmospheric composition and structure; discuss atmospheric heat transfer and the earth's energy balance; derive the various forces which are at work in the atmosphere, and apply them in wind calculations; explain the physical processes involved in cloud formation and precipitation; assess the possibility of thunderstorm development with the use of tephigrams and certain stability indices and explain various atmospheric phenomena such as hail and lightning.

#### Practical work

Calculation of atmospheric forces and wind components using basic numerical modelling; plotting and analysing of thermodynamic diagrams in weather forecasting

#### LWR444 (16 credits) - Synoptic meteorology

Three lectures and a three hour practical per week.

One examination paper of three hours.

The student will be made familiar with the synoptic climatology and the large scale tropical and extra-tropical weather systems that may affect southern Africa. Various theoretical models are introduced and explained with the use of numerical models. Skill in the interpretation of satellite and radar imagery is expanded. After completion students will be able to issue general weather forecasts.

#### Practical work

Various forecasting techniques are used to compile a five-day forecast on a weekly basis. Such a forecast is based on theoretical knowledge as well as the analysis and interpretation of synoptic weather charts, meteorological observations, numerical model outputs and remotely sensed imagery.

#### LWR451/461 (4 credits) - Seminar in Agrometeorology

No formal examination is required.

The student will gain knowledge of the principles of writing seminars by using the library for literature searches. During the preparation, writing and presentation of a seminar on an approved

topic in agrometeorology, students will develop the necessary evaluation and communication skills required to succeed as a research scientist.

# **Animal Science**

# DAF314 (16 credits) - Animal anatomy and physiology of farm animals

Three lectures and a three hour practical per week.

One examination paper of three hours and an oral examination.

After completion the student is familiar with the micro- and macroscopic studying of the animal body according to the systematic method; the physiology of the nervous system, muscle system, blood and circulatory system, respiratory system and the basic endocrine control of growth, metabolism, behaviour and reproduction.

# Practical work

The student performs macro and microscopic studies and dissections of tissues and organs. Basic physiological concepts such as muscle contraction, blood pressure, blood composition, heart action and endocrine glands are demonstrated.

# DAF324 (16 credits) - Animal health

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion the student is familiar with the causes, symptoms, lesions, diagnoses and control measures of the most important animal diseases of farm animals; vaccination and dosing of farm animals; general characteristics of the immune reaction; resistance against parasites and pathogens; dystocia.

# Practical work

Elementary diagnostic procedures and post mortem procedures and simple surgery and obstetrics are performed. RIA determinations and other immunological techniques are studied.

# DAF414 (16 credits) - Applied reproduction physiology in farm animals

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion the student is familiar with concepts such as rate of reproduction and means of increasing it in farm animals and poultry; gametogenesis; endocrine control of reproduction; puberty; factors influencing normal reproduction; teratology; principles and application of synchronisation, artificial insemination, super-ovulation and embryo transfer in sheep goats, cattle and pigs; mating systems and management practices; pregnancy diagnosis; reproduction abnormalities.

# Practical work

Macroscopic examination of sex organs; semen evaluation, demonstration of synchronisation, laparoscopy and pregnancy diagnosis in sheep and cattle are performed. Visits are brought to AI stations, pig and poultry production units and dairies.

#### DAF424 (16 credits) - Growth and lactation physiology

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion the student is familiar with the endocrine control of growth and lactation; embryology; histology of muscle and mammary gland tissue and manipulation of growth; milk production and the biological efficiency of milk production; theoretical aspects regarding milk production; lactation disturbances and mammary gland abnormalities; managerial aspects of sustained high milk yield and the manipulation of growth.

#### Practical work

Visits are brought to production units and the evaluation of production practices.

# DTL314 (16 credits) - Theory of animal breeding

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion the student is familiar with concepts such as Mendelian inheritance, gene and genotypic frequencies, simply inherited and polygenic traits, selection for simply inherited traits, the resemblance between relatives; heritability and repeatability; prediction of selection response; short and long term results of selection; inbreeding and crossbreeding; threshold values and scale effects; genetic and environmental correlations; correlated responses; natural selection; major genes.

#### Practical work

The student estimates heritability; genetic and phenotypic correlation and other parameters.

#### DTL324 (16 credits) - New technologies in animal breeding

Three lectures and a three hour practical per week.

One examination paper of three hours.

Reproductive technologies, cloning, molecular genetic technologies, genetic markers, major genes and the ethical aspects of new technologies in livestock improvement.

#### Practical work

The student gain new knowledge of the practical aspects of this new technology through demonstrations.

# DTL414 (16 credits) - Animal breeding: Mixed model theory

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion the student is familiar with the genetic model for quantitative traits, the use of matrix algebra in breeding value prediction; statistics and the use in animal breeding; importance of heritability and repeatability in animal breeding; methodologies for genetic prediction: selection index and BLUP; comparison of contemporaries; correction factors and optimisation of selection; prediction of breeding values and the principle of mixed models: Sire model, animal model, Bayes theory, QTL's.

#### Practical work

The student estimates breeding values and is familiarised with the application of breeding values. The use of computer programmes is mastered.

# DTL424 (16 credits) - Animal breeding: Practical application

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion the student is familiar with the basics of practical animal breeding; selection objectives; selection trials; mating systems; selection techniques; national livestock improvement schemes; selection for growth and efficiency; genotype x environment interactions; unique breeding problems in different breeds and species; linear type traits.

# Practical work

The student interprets performance test data and herd profiles; conduct practical selection of breeding stock; evaluate breeding programmes. Demonstration of commercial herd/flock management software as used in different livestock industries.

# DVL314 (16 credits) - Applied monogastric nutrition

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion the student is familiar with the principles of nutrition; feed type; formulation of diets; feeding systems; feeding facilities; housing and production management in poultry, pigs and horses. **Practical work** 

Visits are brought to production systems for broilers, laying hens and pigs.

# DVL324 (16 credits) - Applied ruminant nutrition

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion the student is familiar with the nutrient requirements and nutritional management of dairy cattle, dairy calves, beef cattle, sheep, goats and game during different physiological stages; extensive and semi-intensive feeding systems for livestock, including drought feeding, overwintering, stall feeding and supplementation on veld.

#### Practical work

Balancing rations.

# DVL414 (16 credits) - Fundamental and experimental animal nutrition

Three lectures and a three hour practical per week.

One examination paper of three hours and an oral examination.

After completion the student is familiar with the concepts of feeds and nutrients (water, carbohydrates, lipids, proteins, minerals and vitamins); digestive systems (monogastric, ruminant and lower digestive tract fermentors), digestion, absorption and metabolism; nutrient deficiencies, toxicity and metabolic disturbances; digestibility of feeds and feed components; techniques for the evaluation of feeds and pastures; protein and energy requirements for monogastric animals, ruminants and lower digestive tract fermentors.

#### Practical work

Students perform practical feeding and the handling of animals, digestion trials and carry out laboratory techniques.

# DVL424 (16 credits) - Properties of feeds, balancing rations and fodder flow planning

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion the student is familiar with the classification, nutritional characteristics, processing and toxicity of feeds; feed additives and by-products; quality control, balancing of diets and feeding management.

# Practical work

The student performs linear programming, computer assisted balancing of diets and fodder flow management. Visits are brought to farming production units.

# DVL444 (16 credits) - Applied nutrition of wild herbivores and carnivores

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion the student is familiar with the principles of nutrition, nutrients and the digestive systems of important groups of wild herbivores and carnivores in Africa. Diet selection, as well as the utilization of grasses, shrubs and trees by different wild herbivore species, is related to habitat preferences. Activities such as prey selection, hunting techniques, scavenging and the utilization of prey animals by wild carnivore species are related to their social behaviour and habitat. The nutrition and dietary requirements of wild animals are studied for both *in situ* and *ex situ* situations. **Practical work** 

Assignments form an integral part of the module, both for the theory and the practical work. Developing skills in identifying wild animal species, including their spoor and faecal excretion. Prey animals are identified anatomically by means of the remains of carcasses and the faeces of predators. Techniques are studied and applied to determine and study qualitative and quantitative aspects of the nutrition of wild animals.

#### VKD214 (16 credits) - Introductory ruminant production

Three lectures and a three hour practical per week. One examination paper of three hours.

After completion the student will be familiar with the general principles of beef, dairy, sheep and goat production, the role of the four industries in South Africa, different breeds, the effect of nutrition, breeding, physiology and health on the efficient production of beef, mutton (lamb meat), milk and wool.

#### Practical work

Visits to beef, dairy, sheep and goat production and processing units will be arranged to expose students to the different aspects of the production systems commonly used in South Africa. Basic animal husbandry skills (dipping, dosing, vaccination, castration, dehorning etc.) will be demonstrated and performed. The basic principles of meat, milk and wool evaluation will be demonstrated.

#### VKD224 (16 credits) - Introductory monogastric, wildlife and aquaculture production Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion the student will be familiar with the general principles of horse husbandry, pig, poultry, wildlife, ostrich and aquaculture production, the role of the industries in South Africa, different breeds, the effect of nutrition, breeding, physiology and health on the efficient production of meat and eggs.

#### Practical work

Visits to various production and processing units will be arranged to expose students to the different production systems commonly used in South Africa. Basic animal husbandry skills (dipping, dosing, vaccination, castration, docking etc.) will be demonstrated and performed. The basic principles of meat and egg evaluation will be demonstrated.

#### VKD451/461 (4 credits) - Seminar in Animal Science

Continuous evaluation. No formal exam is required.

Knowledge concerning the principles for writing seminars and scientific publications, assimilating literature using the library for searches, writing and presenting a seminar according approved procedures are conveyed to students. Students are expected to apply this knowledge by writing and presenting a seminar on an animal science topic.

# **Food Science**

## VDS214 (16 credits) - Food preparation

Three lectures and a three hour practical per week.

One examination paper of three hours.

Measuring and recipe science: practical application of principles. WATER: latent and specific heat. Conventional heat and microwave heat transfer. COOKING METHODS: dry and moist heat. Fruit, vegetables, legumes and nuts. Natural colour pigments. Lipids as applied to food preparation. Salads and salad dressings. Protein as applied to food preparation. Gelatine and gelatine dishes. Milk and milk products. Cheese and cheese products. Eggs and egg dishes. MEAT: selection, storage and cooking. POULTRY: selection, storage and cooking. FISH: classification, selection, storage and cooking. SOUP: classification and preparation.

# Practical work

Food preparation concerning aspects of the theory.

#### VDS224 (16 credits) - Food preparation

Three lectures and a three hour practical per week.

One examination paper of three hours.

Measuring and recipe science: practical application of principles. Terminology of food preparation. Carbohydrates as applicable to food preparation. Cereals, cereal products and sauces. BAKING: ingredients, batter and kinds of dough. SUGAR: classification, properties and uses. SUGAR COOKERY:

crystalline and amorphous sweets. PRINCIPLES OF MEAL PLANNING: food groups. Daily menu plan with portion sizes. Herbs and spices.

#### Practical work

Food preparation with regard to aspects of the theory.

# VDS344 (16 credits) - Food preservation and meal planning

Three lectures and a three hour practical per week.

One examination paper of three hours.

Preserving. Freezing of food. Packaging of food. Meal planning: menus and application of economic and gastronomic principles. Art of entertaining: formal and informal. International eating habits. **Practical work** 

Preserving. Planning and preparation of meals and receptions.

#### VWS212 (8 credits)- Introductory Food Science

Three lectures per week.

One examination paper of three hours.

The student will learn to know the nutritional aspects of food components, food fermentation, milk, milk production, meat, poultry, eggs and egg processing, fruit and vegetables, alcoholic and nonalcoholic beverages, banquetry and chocolate products.

# VWS222 (8 credits) - Chemical analysis of food

Three hour practical per week.

One examination paper of three hours.

The student will be able to do the following: basic chemical concepts and calculations, water content and water activity determination in food. Qualitative and quantitative determinations of carbohydrates, proteins, lipids, minerals, vitamins and additives based on gravimetric, photometric and chromatographic techniques.

#### VWS224 (16 credits) - Food systems

Three lectures and a three hour practical per week.

One examination paper of three hours.

FOOD SYSTEMS: The student will get acquainted with classification, composition, properties, structure, application, nutritional values, preservation, decay, toxicology, quality. Intermediate moisture foods. Food analogues. FOOD ADDITIVES: classification and application. CONVENIENCE FOODS: classification and factors which influence application. Applied nutritional and human physiological principles.

# Practical work

The students will be able to use the classification, composition of the structure and application of food additives practically.

# VWS232 - Food chemistry

Three lectures per week.

One examination paper of three hours.

The student will be exposed to the following aspects: chemical and physical properties of water, carbohydrates, proteins and lipids. WATER, physical properties of water and ice, sorption phenomena, water types, freezing and ice structure, water activity. CARBOHYDRATES: classes, structure, chemical reactions and functions in food, PROTEINS: amino acid composition, classification, protein structure, denaturation, chemical reactions and functions in food. Proteins of different origin. LIPIDS: composition and structure, types, chemical reactions during deterioration due to heat, irradiation and storage, chemical reactions and functions in food.

# VWS314 (16 credits) - Food products from animals

Three lectures and a three hour practical per week. One examination paper of three hours.

The following principles of processing of meat and milk will be addressed in the module: **Meat** 

Composition and chemistry of meat. Conversion of muscle to meat. Pigments of meat and its effect on meat processing. Chemistry involved in the ripening of meat and the flavour and taste of meat. Functional properties of meat proteins. Principles involved in stunning, bleeding and skinning animals. Electrical stimulation. Warm deboning of meat. Processing of by-products. Quality of fresh meat. Packaging of meat.

Dairy

Milk processing, the production of milk powder, condensed milk, frozen dairy products, dairy smears. Introduction to fermented products with special reference to cheese and yoghurt. **Practical work** 

# Meat

Studying the slaughter line at an abattoir. Ability to cut a carcass into different cuts. Evaluate the quality of meat. Process meat products.

#### Dairy

Studying the processing line at a dairy. Evaluate the chemical and microbiological quality of milk. Process dairy products.

# VWS324 (16 credits) - Food products from plants

Three lectures and a three hour practical per week.

One examination paper of three hours.

The student will be qualified with knowledge for the processing of sorghum, barley, rice, malting and brewing practices, starch technology and extrusion practices. Plant pigment and flavours will be studied, as well as after-harvest technology of vegetables and fruit, minimal processing requirements (MPR), fruit juices, dehydration and drying of plant products. Packaging of liquid and solid food is done.

# Practical work

The student will be able to evaluate ripeness stages and quality determinations of cereals, oil seeds, vegetables and fruit, as well as apply storage and basic processing techniques.

# VWS334 (16 credits) – Food engineering

Three lectures and a three hour practical per week.

One examination paper of three hours.

The student will be able to use the following principles:

Factory planning. Energy, thermodynamics and heat transfer. Conduction, convection, radiation, heat exchangers. Mass transfer. Steam supply. Design of a factory for evaporation and drying of liquid foods and applicable principles. Supply of refrigeration and cold rooms. Compressed air: In work place cleaning and its engineering principles. Engineering aspects involved in factory effluents. Automatisation and instrumentation.

# Practical work

A study tour during the April holiday is undertaken during which the student will study the layout and functioning of production lines.

# VWS344 (16 credits) - Food microbiology

Three lectures and a three hour practical per week.

One examination paper of three hours.

The student will study and be able to apply the following aspects:

The microbiology of plant and animal products (dairy meat, vegetables, fruit, cereals). Contamination, spoilage and pathogens in food products. Organisms involved with the processing of food products. Predictive microbiology.

Quality management and sanitation in the food industry. Quality management and control. Quality assurance programmes (HACCP, ISO, etc.). Sanitation with regard to quality assurance. **Practical work** 

Sampling of a variety of food types and food contact surfaces. Isolation and identification of 114

organisms and pathogens from food products. Laboratory management and safety. Setting critical control points for a specific food factory.

# VWS414 (16 credits) - Food products from plants: advanced

Three lectures and a three hour practical per week.

One examination paper of three hours.

The student studies the functional, biochemical and quality aspects of the components of wheat and thus importance in baked goods. Functional biochemical and quality aspects of soy and their importance in soy products.

Concerning vegetables and fruit, quality before and after processing, shelf life, microbiology with relationship to different processing techniques, biological and chemical changes during modified atmosphere storage of MPR vegetables and fruit is studied.

#### Practical work

The student will learn to interpret quality parameters of wheat quality and oil quality, as well as the determination of anti-nutrients in legumes. Pigments and colour determinations will be mastered. Processing techniques of seeds, vegetables and fruit will be mastered.

# VWS424 (16 credits) - Dairy Science

Three lectures and a three hour practical per week.

# One examination paper of three hours.

Dairy products: Scientific principles during the industrial processing of cheese and other fermented dairy products. The evaluation and handling of raw product and raw material. Rennet and acid coagulation of milk and the factors that effect it. Handling of starter cultures. Curd processing. After treatment of curd. Ripening, packaging, storage and evaluation of cheese. Mechanisation. Classification of cheese. Processing, packaging and handling of yoghurt and cottage cheese. Practical work

Case studies regarding production management and -planning of products will be studied. Processing of fermented products will be mastered, with associating analysis, quality control and packaging aspects.

# VWS434 (16 credits) - Product development and sensory analysis

Three lectures and a three hour practical per week.

One examination paper of three hours.

The student studies the multi-disciplinary nature of product development. Definitions and criteria for new product development, principles, approaches. The consumer. Relationship between sensory evaluation and product development. The student will apply the role of product development in the food industry.

#### Practical work

The student develops a product in which all theoretical aspects of product development will be applied, along with knowledge obtained in previous years. Techniques used in sensory analysis will be mastered.

#### VWS444 (16 credits) - Meat Science

Three lectures and a three hour practical per week.

One examination paper of three hours.

Meat products: Principles involved in manufacturing whole-muscle, minced and emulsified meat products. Restructured, canned, fermented, dried and intermediary moisture meat products. Curing, smoking and cooking of meat products. Additives in meat products. Non-meat ingredients in meat products. Formulation of a meat product.

#### Practical work

Case studies will be done regarding the slaughter line at poultry and red meat abattoirs. Effect of processing and storage on meat quality is studying with respect to: processing techniques, analysis, quality control and packaging.

# VWS451/461 (4 credits) - Seminar in Food Science

Two theory periods per week.

Literature oriented instructions with regard to food problems of a microbiological, chemical or process-related nature as well as other aspects of concern to the food industry.

# **Grassland Science**

# WDK224 (16 credits) - Veld as natural resource

Three lectures and a three hour practical per week. One examination paper of three hours.

After completing this module the student will know the ecological and economic significance of veld in the RSA and certain other parts of the world. Development of skills in identifying southern African veld types, game farming areas and biomes: characteristics, agricultural potential, production capacity and conservation status. Students will describe and evaluate the causes and results of vegetation changes. Identification and description of South African fodder plants: grasses, bushes, Karoo shrubs, trees and legumes as well as indicator and problem plants will be done. Bringing physiological approach to ecosystem utilisation in proper relation to optimal growth and development of fodder plantson a basic level. After completion of the module the student will be able to evaluate the ecological aspects which influence the functioning of the grassland ecosystem (domestic and wildlife).

## Practical work

Identification of fodder plants and veld types regarding desirability, production capacity and ecological status will be done. Herbarium collection of fodder plants.

#### WDK314 (16 credits) - Applied veld management and veld evaluation

Three lectures and a three hour practical per week.

One examination paper of three hours.

The aims and principles of veld management with livestock and wildlifewill be studied in this module. Knowledge of grazing habits of livestock and wildlife and selective grazing will be attained. Identification and analysing of veld management methods and strategies will be discussed. Determination of production and quality of veld will be studied. The student will be equiped to determine grazing capacity and stocking rate. Students will be familiar with the importance of record-keeping of veld. The student will be able to do scientific planning of a farm unit and study the methods for evaluating grasslands in respect of cover, botanical composition and veld condition. The student will bring game farm planning in proper relation to management and utilisation of game.

### Practical work

Physical and biological planning of a farming unit will be done. Students will gain practical skills in application of different techniques to establish veld condition, production, quality and grazing capacity. Practical reports must be handed in.

# WDK324 (16 credits) - Intensive pasture production

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion of the module the student will knowf the importance, extent and purpose of intensive pasture production in the RSA. The student will gather information about seed germination of fodder plants. Evaluation of factors important in veld reclamation and veld reinforcement will be discussed. Identification and evaluation of suitable crops for planting/cultivating: cultivation aspects, choice of crops, nutritive value, quality, utilisation and forage conservation will be studied. The student must integrate all the information to do fodder flow planning.

# Practical work

The student should be able to develop skills on identification of grasses and legumes for establishment and veld improvement. Study and evaluation of management practices on farms. Designing fodder flow programmes.

# WDK414 (16 credits) - Production and utilisation ecology

Three lectures and a three hour practical per week.

One examination paper of three hours.

The grassland ecosystem (interactions, structure and functioning) and the farmer as manager will be studied in this module. The student should be able to evaluate the sustainability of the grassland ecosystem and the factors that may influence it. The student should bare a higher level of knowledge on the outputs of the grassland ecosystem. Identification and analysing of ecological game farming areas and ecosystem characteristics in connection with game-species and its social behaviour and habitat preferences. Evaluation and analysing the hydrological and other cycles in the grassland ecosystem with reference to the influence of utilisation and management will be discussed. The student will be equiped with the development of models for the prediction of production and utilisation of the grassland ecosystem. After completion the student should be familiar with pollution and preservation of the grassland ecosystem.

#### Practical work

Evaluation of the influence of utilisation and management on productivity of the grassland ecosystem under different veld conditions will be done. Identification and description of plant growth habitat relationships.

# WDK424 (16 credits) - Advanced veld management

Three lectures and a three hour practical per week.

One examination paper of three hours.

Knowledge of the extent and history of the conservation idea will be studied in this module. Identification of the causes and results of veld deterioration (erosion) and measures to combat it will be done. The student should be able to identify the importance of veld management in different veld types and the critical evaluation of system/practices. Identification and analysing the grazing habits of livestock and game and selective grazing. Determination of grazing capacity and stocking rate and application of special treatments for veld will be discussed. Students will carry out veld management planning and bringing applied wildlife management in proper relation to marketing, legal aspects, economics and sosio-economical aspects of game. Students will be familiar with the management of communal areas.

#### Practical work

Determinationo of veld condition and production planning will be applied for the physical and biological planning of a veld management system on both a livestock and game farming unit.

Excursions, during which practical work regarding veld condition, evaluation and practical veld management will be critically discussed, are compulsory. Practical reports on these excursions must be submitted.

# WDK434 (16 credits) - Defoliation phenology and physiology

Three lectures and a three hour practical per week.

One examination paper of three hours.

The student will have a higher level of knowledge on physiological and phenological aspects of fodder plants. The student have to gain information about water absorption, translocation and food storage in fodder plants as applicable to grassland management. Identification of critical periods (phenological and physiological) in the seasonal growth cycle of grasses, legumes, fodder shrubs and bushes. Be adjusted to the influence of intensity, frequency and season of defoliation on net assimilation rate, root growth, growth reserves and plant growth changes of grasses, bushes and Karoo shrubs. Bringing the influence of water shortages in proper relation to the growth and development of fodder plants. Students will gain knowledge of seasonal variation in nutritional value and quality of fodder plants.

# Practical work

Analysing of the influence of intensity and frequency of defoliation on production and root growth of fodder plants will be done. Identification of the growth cycle, leaf lengths and leaf surfaces of fodder plants. Introduction to devices such as infrared gas analyser, leaf surface meter, neutron water meter and transpiration meter.

# WDK444 (16 credits) - Advanced fodder plant evaluation

Three lectures and a three hour practical per week.

One examination paper of three hours.

After completion the student will have a higher level of knowledge on the classification of vegetation and identification of the variables that influence the grassland ecosystem. Planning and conducting of grassland science research will be carried out. Sampling, arrangement, statistical tests and simulation models applicable to the grassland ecosystem will be done. Student should be able to identify methods to measure variables and the productivity of the grassland ecosystem and knowledge of the practical application of the techniques. Evaluation of applied livestock and wildlife management systems will be studied. Student should be familiar with the principles, application and limitations of the most important wildlife management Research methodology .

#### Practical work

Practical skills will be developed in different techniques (veld work and computer), applicable to grassland science. Report and processing of data.

#### WDK451/461 (4 credits) - Professional skills

Continuous evaluation. No formal exam is required.

Knowledge attain concerning the principles for writing seminars and scientific publications, acquiring literature and consultation thereof, gathering of information, writing and presenting a seminar on a grassland scientific subject, project presentations and reports; communication skills development.

# **Plant Breeding**

# PLT224 (16 credits) - Breeding techniques

Three lectures and a three hour practical per week.

One examination paper of three hours.

This module serves as an introduction to plant breeding. On completion the student will be acquainted with the basic concepts and terminology of plant breeding. The student will have the knowledge to develop self-polinated, cross-polinated and vegetatively propagated species. Although the emphasis is on conventional plant breeding, students are exposed to laboratory and biotechnological techniques that may improve breeding efficiency. Differences between qualitative and quantitative characteristics, and how the breeder can select for them, are also addressed. Practical

Practical breeding techniques as applicable under greenhouse and field conditions.

# PLT314 (16 credits) - Selection methods

Three lectures and a three hour practical per week.

This module concerns the different selection methods that can be used by the breeder for crop improvement. These methods include selection for qualitative and quantitative characteristics in self-pollinating, cross-pollinating and vegetatively propagated species. Response to selection, the influence of environment on the genotype and the genetic basis of inbreeding and heterosis are emphasized. On completion of the module the student will have the knowledge to decide on the most appropriate selection procedure for a specific breeding aim. Practical

Practical breeding in the greenhouse and tutorials.

# PLT424 (16 credits) - Advanced breeding techniques

Three lectures and a three hour practical per week.

One examination paper of three hours.

This module will equip the student with knowledge on breeding techniques such as mutation breeding, tissue and anther culture, recombinant DNA-technology and plant transformation. Furthermore, legislative, labeling and ethical issues of genetically modified organisms (GMO's) are addressed.

This knowledge will make the student competitive in the workplace where new technology and GMO's have become an everyday reality.

Practical

Practical exercises in selected techniques, supported by demonstrations and discussions.

# PLT461 (4 credits) - Seminar in Plant Breeding

Continuous assessment. No formal examination is required.

The student acquires information on a specified topic in plant breeding and assimilates the information in an organized and logical format according to the requirements for scientific publications. The seminar is also presented orally.

# **Plant Pathology**

# PPG214 (16 credits) - Principles of Plant Pathology

Three lectures and a three hour practical per week.

One examination paper of three hours

On completion of this module the student will be acquainted with the impact, causes and diagnosis of plant diseases and the reasons why plant pathology is considered an important field of study. The student will have a sound understanding, based on the basic concepts of infection and colonization of plant tissue, of how plant diseases arise and develop and how to approach disease problems.

# Practical work

In conjunction with the theory of plant pathology the student will be capable of identifying diseases of the most important economic crops and of prescribing control methods. The student will also be experienced in the collection, identification, description and preservation of herbarium specimens.

#### PPG314 (16 credits) - Principles of plant disease control

Three lectures and a three hour practical per week.

One examination paper of three hours.

On completion of this module the student will be acquainted with the measuring of plant disease and control of diseases based on the principles of *exclusion, eradication, protection* and *resistance*. Following identification of a specific disease the student must therefore know which principle(s) of control is relevant and which strategies should be followed for the prevention or control of the disease.

#### Practical work

After completion of the practical module the student will be skilled in certain aspects of plant pathological research.

# PPG324 (16 credits) - Plant health management

Three lectures and a three hour practical per week.

One examination paper of three hours.

On completion of this module the student will be acquainted with ecological and economic concepts 119

that underlie the management of plant diseases within the context of a sustainable and integrated pest management (IPM) system. The student will be well versed in the basic ecological principles pertaining to the stability and diversity of natural ecosystem vs. agro-ecosystems as influenced by variation in agricultural crops and pathogenic micro-organisms. An understanding of economic thresholds as they relate to crop yield, or losses, will enable the student to translate ecological considerations into economic ones.

# Practical work

Together with a sound knowledge of integrating disease control tactics, by means of case studies, the student will thus be well trained in developing disease control strategies that are both efficient and cost-effective.

# PPG414 (16 credits) - Fungal diseases of plants

Three lectures and a three hour practical per week.

One examination paper of three hours

On completion of this module the student will be acquainted with the taxonomy and general characteristics of fungi, with specific reference to plant pathogens. The student will also be trained in the types of diseases that are caused by the main groups of fungi.

#### Practical work

After completing the practical module the student will be able to identify the most important groups of plant pathogenic fungi and the symptoms they produce in plants.

#### PPG424 (16 credits) - Plant diseases caused by bacteria and viruses

Three lectures and a three hour practical per week.

One examination paper of three hours.

This module will equip the successful student with a sound knowledge of the characterisation (i.e. morphology and classification) and ecology (survival and transmission) of bacteria, viruses and other procaryotic organisms that cause plant diseases. Various methods of managing or controlling diseases caused by these organisms will also be discussed.

#### Practical work

The practical module will teach the student how to isolate and identify important plant pathogenic bacteria using specialised culture media.

# PPG434 (16 credits) - Epidemiology of Plant Diseases

Three lectures and a three hour practical per week.

One examination paper of three hours

After completing this module the candidate will understanding the temporal and spacial aspects of plant disease development. The student will also be aquainted with how these aspects, together with the environment and host factors influence disease development in populations and how they can be integrated to control diseases.

#### Practical work

Following this module, the student will have practical eperience in quantitative epidemiology.

# PPG444 (16 credits) - Host-pathogen interactions

Three lectures and a three hour practical per week.

One examination paper of three hours.

The successful student will after completing this module have a sound knowledge of the physical and physiological effects that plant pathogens have on their hosts, particularly the methods they use to attack plants and how plants in turn defend themselves.

#### Practical work

Tutorial classes dealing with case studies of specific diseases extend the knowledge base of the student, particularly with regard to the variety of interactions between host and pathogen.

# PPG451/461 (4 credits) - Seminar in Plant Pathology

Continuous evaluation. No formal examination.

A student will, after completing this module, have practical experience in assimilating literature, writing and presenting a review of a plant pathological subject. Important communication skills of specific relevance to the profession of plant pathology will also form part of the student's skills.

# **Soil Science**

# GKD214 (16 credits) - Soil ecology

Three lectures and a three hour practical per week. One examination paper of three hours.

Outcome:

Introduction to soil as a natural resource and the role of soil in natural and agricultural ecosystems. **Contents:** 

Composition of soil and the function in natural and agricultural ecosystems. The soil profile, master horizons, soil forming factors and processes. Basic morphological, physical, chemical and biological soil properties.

# Practical work

Field investigations of selected soil profiles and the study of morphological, physical, chemical and biological soil properties.

# GKD314 (16 credits) - Soil evaluation and land use planning

One examination paper of three hours.

Outcome:

Expertise on the identification, classification, mapping and land use suitabilities of soils. **Contents**:

Soil classification with special reference to the South African system. Soil mapping techniques and guidelines for compiling soil maps. Soil evaluation for agricultural and non-agricultural land use planning.

#### Practical work

Fieldwork in soil classification and mapping as well as the evaluation of soils for different land uses.

# GKD324 (16 credits) - Sustainable soil and water management

Three lectures and a three hour practical per week.

One examination paper of three hours.

# Outcome:

Managing knowledge to evaluate and adjust production processes in order to maintain or improve soil and water quality.

Contents:

Importance of soil and water quality for sustainable agricultural production. Optimisation of soil water use for dry land and irrigation farming. Principles on the management of soil fertility, acidity, alkalinity and erosion. Soil tillage methods and practices.

#### Practical work

Laboratory and field studies in soil and water management. Interpretation of soil analyses and the compilation of fertilisation programs.

# GKD414 (16 credits) - Soil chemistry

Three lectures and a three hour practical per week. One examination paper of three hours.

#### Outcome:

Advanced knowledge of the chemical reactions and processes that occur in soils and its effect on natural and agricultural ecosystems.

Contents:

Advanced colloid chemistry. Soil pH, cation and anion exchange reactions. Redox reactions of soil constituents. Soil acidity and alkalinity. Chemistry of important plant nutrients in soil. Soil pollution and its impact on the environment.

#### Practical work

Soil analyses and determination of chemical equilibriums in soils.

# GKD424 (16 credits) - Soil biology

Three lectures and a three hour practical per week. One examination paper of three hours.

#### Outcome:

Knowledge of the decomposition of organic matter, synthesis of humus and the impact on soil quality of natural and agricultural ecosystems.

#### Contents:

Activity and role of macro- and micro-organisms in soil. Interaction between plant roots and microorganisms in soil. Chemical changes that biological residues undergo in soil. Composition of humus and the fractionation of it. Properties of humus and the effect of it on the biological, chemical and physical properties of soils. Maintenance and improvement of biological soil quality.

# Practical work

Isolation of bacteria, fungi, algae, actinomycete and nematodes from soil. Extraction of humus from soil and its fractionation.

# GKD434 (16 credits) - Soil physics

Three lectures and a three hour practical per week. One examination paper of three hours.

#### Outcome:

Advanced knowledge of the hydraulic and physical processes in soils and the effect on natural and agricultural ecosystems.

#### Contents:

A study on the physical and hydraulic properties of and the processes in soils. Analysis of the flow process of water through saturated and unsaturated soils, the infiltration, redistribution and evaporation process. Movement of water to plant roots. Soil temperature and heat flow. Soil aeration and gas exchange. Mechanical properties of soils.

#### Practical work

Laboratory and field investigations in respect of different physical, hydraulic and mechanic properties.

#### GKD444 (16 credits) - Soil geography

Three lectures and a three hour practical per week. One examination paper of three hours.

#### Outcome:

Advanced knowledge of the genesis, geographical distribution and suitability of the soils in South Africa.

# Contents:

The study of soil as three-dimensional bodies in the landscape in respect of genesis, morphology and mineralogy. Soil classification with special reference to other countries. Distribution, genesis and properties of South African soil types.

#### Practical work

Discussion of the origin, morphology, classification and use of soil during field excursions and a compulsory tour. Identification of primary and secondary minerals in soils.

#### GKD461 (4 credits) - Seminar in Soil Science

No formal examination is required.

#### Outcome:

Skills to gather information on a specific topic in soil science, writing it up and presenting it to an audience.

# Contents:

The principles concerning the collection and synthesis of information with literature searches as well as the written and oral presentation thereof according approved procedures are conveyed to students. Students are expected to apply this knowledge by writing and presenting a seminar on a soil science topic.

# Module contents not in this calendar

The contents of modules not in this book can be found in other calendar.

For BOC, BCC, BLG, BMT, BRS, BTG, CEM, ENT, FSK, GEN, GWS, GLG, MKB, PLK, BRS, STK, VMD and WTW consult the calendar of the Faculty of Natural and Agricultural Sciences, Part 1.

For BEL, EKN, GEB, HUM, OBS, ORG, REK and RLB consult the calendar for the Faculty of Economic and Management Sciences.

Postgraduate Agricultural Programmes: See Calendar Part 3, Faculty of Natural and Agricultural Sciences.
